DESCRIPTORS: \*Germanium, Reduction, Electrodes,  
Mercury, Electrochemistry.

By the method of polarographic coulometry it is established that the reduction of tetravalent germanium at the mercury drop electrode takes place with the participation of four electrons. Anode-cathode waves of germanium were obtained with the amalgam drop electrode and the dependence of the reduced exchange current and reversible half-wave potential on germanium concentration and hydrogen ion concentration in the solution.
